Building Functions	High School	<p>My concern relates to several content domains. I believe the MO standards using the Common Core pushes too many skills and concepts to students who are too young to fully understand the material. The other concern is that too much material is being placed in Algebra 2. What is the reasoning for putting so much Trigonometry into the Algebra 2 curriculum? What happens to the course called "Trigonometry?" Students have a very difficult time as it is to master the concepts in traditional Algebra 2. I have taught for 30 years and support more problem solving but there is no time to truly give it justice. I don't understand the push to make jr high students do Algebra I material, etc. Where is the research that supports this move?</p>	Yes	Educator	65721
