Introduction

In 2014 Missouri legislators passed House Bill 1490, mandating the development of the Missouri Learning Expectations. In April of 2016, these Missouri Learning Expectations were adopted by the State Board of Education. Groups of Missouri educators from across the state collaborated to create the documents necessary to support the implementation of these expectations.

One of the documents developed is the item specification document, which includes all Missouri grade level/course expectations arranged by domains/strands. It defines what could be measured on a variety of assessments. The document serves as the foundation of the assessment development process.

Although teachers may use this document to provide clarity to the expectations, these specifications are intended for summative, benchmark, and large-scale assessment purposes.

Components of the item specifications include:

- **Expectation Unwrapped** breaks down a list of clearly delineated content and skills the students are expected to know and be able to do upon mastery of the Expectation.

- **Depth of Knowledge (DOK) Ceiling** indicates the highest level of cognitive complexity that would typically be assessed on a large scale assessment. The DOK ceiling is not intended to limit the complexity one might reach in classroom instruction.

- **Item Format** indicates the types of test questions used in large scale assessment. For each expectation, the item format specifies the type best suited for that particular expectation.

- **Content Limits/Assessment Boundaries** are parameters that item writers should consider when developing a large scale assessment. For example, some expectations should not be assessed on a large scale assessment but are better suited for local assessment.

- **Sample stems** are examples that address the specific elements of each expectation and address varying DOK levels. The sample stems provided in this document are in no way intended to limit the depth and breadth of possible item stems. The expectation should be assessed in a variety of ways.

- **Possible Evidence** indicates observable methods in which a student can show understanding of the expectations.

- **Stimulus Materials** defines types of stimulus materials that can be used in the item stems.

**Expectation Unwrapped**

Make observations and/or measurements of an object’s motion to provide evidence that a pattern can be used to predict future motion.

[Clarification Statement: Examples of motion with a predictable pattern could include a child swinging in a swing, a ball rolling back and forth in a bowl, and two children on a see-saw.]

**SCIENCE AND ENGINEERING PRACTICES**

Planning and Carrying out Investigations
- Make observations and/or measurements to provide evidence for the explanation of a pattern within a phenomenon.

**DISCIPLINARY CORE IDEAS**

Forces and Motion
- The patterns of an object’s motion in various situations can be observed and measured: when that past motion exhibits a regular pattern, future motion can be predicted from it.

**CROSSCUTTING CONCEPTS**

Patterns
- Patterns of change can be used to make predictions.

**Content Limits/Assessment Boundaries**

- Technical terms, such as *period* and *frequency*, should be avoided

**Item Format**

Selected Response
- Constructed Response
- Technology Enhanced
### Possible Evidence

- Students recognize and then describe the phenomenon under investigation and describe the purpose of the investigation, including the idea that patterns of motion can be used to predict future motion of an object.
- Students recognize and then describe the data to be collected through observations and/or measurements and describe how the data will serve as evidence of a pattern in the motion of an object.
- Students recognize how the data will be collected, including how the motion of the object will be observed and how evidence of the pattern will be recorded, in order to predict a pattern that can be used to predict future motion.
- Students make observations and/or measure an object’s speed or distance. From these observed patterns/measurements, students can predict future motion.

### Stimulus Materials

Graphic organizers, diagrams, graphs, data tables, drawings

**Possible Evidence**

- Students will describe the phenomenon (observable event) under investigation, which includes the effects of different forces on an object’s motion (e.g., starting, stopping, or changing direction).
- Students will describe the purpose of the investigation, which includes producing the data to serve as the basis for evidence for how balanced and unbalanced forces determine an object’s motion.
- Students will collaboratively develop a plan including the change in motion of an object at rest after different strengths and directions of balanced and unbalanced forces are applied and what causes the forces on the object. In the plan, students will describe how the motion of the object will be observed and recorded, including the following information:
  - The object whose motion is being investigated
  - The objects in contact that exert forces on each other
  - Which variable is changing in each trial
  - The number of trials that will be conducted.
- Students collaboratively collect and record data according to the investigation plan, including data from observations and/or measurements of an object at rest and an object in motion and identification of the forces acting on the object.

**Stimulus Materials**

Graphic organizers, diagrams, graphs, data tables, drawings
### Core Idea
**Motion and Stability: Forces and Interactions**

#### Component
**Types of Interactions**

Plan and conduct a fair test to compare and contrast the forces (measured by a spring scale in Newtons) required to overcome friction when an object moves over different surfaces (i.e., rough/smooth).

### Expectation Unwrapped

#### SCIENCE AND ENGINEERING PRACTICES
**Planning and Carrying out Investigations**
- Plan and conduct an investigation collaboratively to produce data to serve as the basis for evidence, using fair tests in which variables are controlled and the number of trials considered.

#### DISCIPLINARY CORE IDEAS
**Types of Interactions**
- The effect of the unbalanced forces on an object results in a change of motion. Patterns of motion can be used to predict future motion. Some forces act through contact; some forces act even when the objects are not in contact. The gravitational force of Earth acting on an object near Earth’s surface pulls that object toward Earth’s center.

#### CROSSCUTTING CONCEPTS
**Cause and Effect**
- Cause and effect relationships are routinely identified.

**Patterns**
- Observed patterns of forms and events guide organizational classification, and they prompt questions about relationships and the factors that influence them.

#### ENGINEERING DESIGN
- Refer to Engineering, Technology, and Application of Science 4.ETS1B.1.

### Content Limits/Assessment Boundaries
- Tasks should not include anything more complex than written or pictorial descriptions.
- Items should not assess a specific sequence in a procedure.

### Sample Stems
## Possible Evidence

- Students will describe the phenomenon (observable event) being investigated, which includes the amount of force (measured by a spring scale, in Newtons) required to overcome friction when an object moves over different surfaces (i.e., rough/smooth).
- Students will describe the purpose of the investigation, which includes producing the data to serve as the basis for evidence for how friction affects the amount of force.
- Students will collaboratively develop a plan including the amount of force required to overcome friction. In the plan, students will describe how the force will be observed and recorded, including the following information:
  - The object whose motion is being investigated
  - The different surfaces the object encounters
  - Which variable is changing in each trial
  - The number of trials being conducted
- Students collaboratively collect and record data according to the investigation plan, including data from observations and/or measurements of the amount of force required.

## Stimulus Materials

- Graphic organizers, diagrams, graphs, data tables, drawings
### Physical Sciences

<table>
<thead>
<tr>
<th>Core Idea Component</th>
<th>Motion and Stability: Forces and Interactions</th>
</tr>
</thead>
<tbody>
<tr>
<td>MLS</td>
<td>Types of Interactions</td>
</tr>
</tbody>
</table>

Predict how changes in either the amount of force applied to an object or the mass of the object affects the motion (speed and direction) of the object.

#### Expectation Unwrapped

**SCIENCE AND ENGINEERING PRACTICES**

**Planning and Carrying Out Investigations**
- Make predictions about what would happen if a variable changes.

**DISCIPLINARY CORE IDEAS**

**Types of Interactions**
- The effect of the unbalanced forces on an object results in a change of motion. Patterns of motion can be used to predict future motion. Some forces act through contact, some forces act even when the objects are not in contact. The gravitational force of Earth acting on an object near Earth’s surface pulls that object toward that planet’s center.

**CROSSCUTTING CONCEPTS**

**Cause and Effect**
- Cause and effect relationships are routinely identified.

#### Content Limits/Assessment Boundaries

- Tasks should not include anything more complex than written or pictorial descriptions.

#### Sample Stems

- Students will change either the amount of applied force or the mass of an object to predict how it will affect the motion (speed and direction) of the object.

**Possible Evidence**

- Students will change either the amount of applied force or the mass of an object to predict how it will affect the motion (speed and direction) of the object.

**Stimulus Materials**

- Graphic organizers, diagrams, graphs, data tables, drawings

<tr>
<td>MLS</td>
<td>Use evidence to construct an explanation relating the speed of an object to the energy of that object.</td>
</tr>
</tbody>
</table>

## Expectation Unwrapped

### SCIENCE AND ENGINEERING PRACTICES

**Constructing Explanations and Designing Solutions**
- Use evidence (e.g., measurements, observations, patterns) to construct an explanation.

### DISCIPLINARY CORE IDEAS

**Definitions of Energy**
- Moving objects contain energy. The faster a given object is moving, the more energy it possesses. Energy can be moved from place to place by moving objects.

### CROSSCUTTING CONCEPTS

**Energy and Matter**
- Energy can be transferred in various ways and between objects.

## Content Limits/Assessment Boundaries
- Tasks should not include quantitative measures of changes in the speed of an object or on any precise or quantitative definition of energy.

## Possible Evidence
- Students recognize and then describe evidence explaining the relative speed of an object, the qualitative indicators of the amount of energy of the object, as determined by a transfer of energy from that object (e.g. more or less sound produced in a collision, more or less heat produced when objects rub together, relative speed of a ball that was stationary following a collision with a moving object, more or less distance a stationary object is moved).

## Stimulus Materials
- Graphic organizers, diagrams, graphs, data tables, drawings
## Grades 3-5 SCIENCE

<td>Conservation of Energy and Energy Transfer</td>
</tr>
<tr>
<td>MLS</td>
<td>Provide evidence to construct an explanation of an energy transformation (e.g. temperature change, light, sound, motion, and magnetic effects).</td>
</tr>
</tbody>
</table>

### SCIENCE AND ENGINEERING PRACTICES

**Constructing Explanations and Designing Solutions**
- Use evidence (e.g. measurements, observations, patterns) to construct or support an explanation or design a solution to a problem.

### DISCIPLINARY CORE IDEAS

**Conservation of Energy & Energy Transfer**
- Energy can be moved from place to place by moving objects or through sound, light, heat and temperature change, and magnetic effects.

### CROSSCUTTING CONCEPTS

**Energy and Matter**
- Energy can be transferred in various ways and between objects.

### Content Limits/Assessment Boundaries
- Tasks should not include quantitative measurements of energy.

### Possible Evidence
- Students describe the transfer of energy, including collisions between objects, light traveling from one place to another, sound traveling from one place to another, magnetic effects from one object to another, and heat passing from one object to another.
- Students describe the investigation and its purpose and how the data will be observed and collected, including the tools and methods for collection, and record observations to provide evidence that energy is present whenever there are moving objects, sound, light, heat, and magnetic force.

### Stimulus Materials
- Graphic organizers, diagrams, graphs, data tables, drawings
### Physical Sciences

<table>
<thead>
<tr>
<th>Core Idea Component</th>
<th>Energy</th>
</tr>
</thead>
<tbody>
<tr>
<td>MLS</td>
<td></td>
</tr>
</tbody>
</table>

#### Expectation Unwrapped

Apply scientific ideas to design, test, and refine a device that converts energy from one form to another.

[Clarification Statement: Examples of devices could include electric circuits that convert electrical energy into motion energy of a vehicle, light, or sound; and, a passive solar heater that converts light into heat. Examples of constraints could include the materials, cost, or time to design the device.]

#### SCIENCE AND ENGINEERING PRACTICES

**Constructing Explanations and Designing Solutions**
- Apply scientific ideas to solve design problems.

#### DISCIPLINARY CORE IDEAS

**Conservation of Energy and Energy Transfer**
- Energy can be transferred from place to place by electric currents, which can then be used locally to produce motion, sound, heat or light. The currents may have been produced to begin with transforming the energy of motion into electrical energy.

#### CROSSCUTTING CONCEPTS

**Energy & Matter**
- Energy can be transferred in various ways and between objects.

#### ENGINEERING DESIGN

Refer to Engineering, Technology, and Application of Science 4.ETS1A.1
Refer to Engineering, Technology, and Application of Science 4.ETS1B.1
Refer to Engineering, Technology, and Application of Science 4.ETS1C.1

#### Content Limits/Assessment Boundaries

- Tasks should not include any devices beyond those that convert motion energy to electric energy or use stored energy to cause motion or produce light or sound.
### Possible Evidence

- Given a problem to solve, students collaboratively design a solution that converts energy from one form to another. In the design, the students will identify the device by which the energy will be transformed (e.g., a light bulb to convert electrical energy into light energy, a motor to convert electrical energy into energy of motion.)
- Students describe the criteria, which include the initial and final forms of energy and a description of how the solution functions to transfer energy from one form to another, and the constraints, which include the materials available and safety considerations.
- Students evaluate the solution, test the device, and use the results to modify the design.

### Stimulus Materials

Graphic organizers, diagrams, graphs, data tables, drawings

</tr>
<tr>
<td>• Tasks should not assess rote memorization of the terms amplitude and wavelength should not be assessed. (Definitions will not be assessed.)</td>
</tr>
</tbody>
</table>
### Possible Evidence

- Students develop a model (e.g., diagrams, analogies, examples, abstract representations, physical models) to identify the relevant components including waves, wave amplitude, wavelength, and motion of objects.
- Students will use the model to describe waves in terms of patterns of repeating amplitude and wavelength, their initiation, and how waves cause an object to move and to describe that the motion of objects varies with the amplitude and wavelength of the wave carrying it.
- Students identify similarities and differences in patterns underlying waves and use these patterns to describe simple relationships involving wave amplitude, wavelength and the motion of an object (e.g., when the amplitude increases, the object moves more).

### Stimulus Materials

- Graphic organizers, diagrams, graphs, data tables, drawings

**Expectation Unwrapped**

[Clarification Statement: Examples of structures could include thorns, stems, roots, colored petals, heart, stomach, lung, brain, and skin.]

**SCIENCE AND ENGINEERING PRACTICES**

Engaging in Argument for Evidence
- Construct an argument with evidence, data, and/or a model.

**DISCIPLINARY CORE IDEAS**

Structure and Function
- Plants and animals have both internal and external structures that serve various functions in growth, survival, behavior, and reproduction

**CROSSCUTTING CONCEPTS**

Systems and System Models
- A system can be described in terms of its components and their interactions.

**Content Limits/Assessment Boundaries**
- Tasks should not include any structures beyond macroscopic structures within plant and animal systems.

**DOK Ceiling**
- 3

**Item Format**
- Selected Response
- Constructed Response
- Technology Enhanced

**Sample Stems**
### Possible Evidence

- Students make claims that plants and animals have internal and external structures that function together as part of a system to support survival, growth, behavior, and reproduction.
- Students describe the internal and external structures and their functions.
- Students determine the strength and weakness of the evidence, its relevancy towards the role of internal and external structures in plants and animals in supporting survival, growth, behavior, and reproduction.
- Students construct an argument that includes the ideas that plants and animals have structures that, together, support survival, growth, behavior, and/or reproduction.
- Students use reasoning that includes the following:
  - Internal and external structures serve specific functions within plants and animals (e.g., the heart pumps blood to the body, thorns discourage predators)
  - The functions of internal and external structures can support survival, growth, behavior and/or reproduction in plants and animals (e.g., the heart pumps blood throughout the entire body, which allows the entire body access to oxygen and nutrients; thorns prevent predation, which allows the plant to grow and reproduce)
  - Different structures work together as part of a system to support survival, growth, behavior, and/or reproduction (e.g., the heart works with the lungs to carry oxygenated blood throughout the system; thorns protect the plant, allowing reproduction via stamens and pollen to occur)

### Stimulus Materials

- Graphic organizers, diagrams, graphs, data tables, drawings
### Life Sciences

<table>
<thead>

Use a model to describe that animals receive different types of information through their senses, process the information in their brain, and respond to the information in different ways.

#### Expectation Unwrapped

[Clarification Statement: Emphasis is on systems of information transfer.]

#### DISCIPLINARY CORE IDEAS

**Information Processing**
- Different sense receptors are specialized for particular kinds of information, which may be then processed by the animal’s brain. Animals are able to use their perceptions and memories to guide their interaction.

#### CROSSCUTTING CONCEPTS

**System and System Models**
- A system can be described in terms of its components and their interactions.

#### Content Limits/Assessment Boundaries

- Tasks should not include the mechanisms by which the brain stores and recalls information or the mechanisms of how sensory receptors function.

---

**Sample Stems**

---

**DOK Ceiling**

- 3

**Item Format**

- Selected Response
- Constructed Response
- Technology Enhanced
### Possible Evidence

- Students use a given model to identify and describe the relevant components, which include different types of information about the surroundings (e.g., sound, light, odor, temperature), sense receptors able to detect different types of information from the environment, brain, and animals’ actions.
- Students describe the relationships between components, including types of sense receptors that send information about the surroundings to the brain, processing the information from the sensory receptors, and describe that the memories processed by the brain influence an animal’s action or responses to environmental features. Different types of sensory information are relayed to the brain via different sensory receptors, allowing experiences to be perceived, to be stored as memories, and to influence behavior (e.g., an animal sees a brown, rotten fruit and smells a bad odor — this information allows the animal to make decisions about what to eat).
- Students also use the model to test interactions involving sensory perception and its influence on animal behavior, including interactions between animal behavior and information in the environment, different types of sense receptors, perception, and memory of sensory information.

### Stimulus Materials

- Graphic organizers, diagrams, graphs, data tables, drawings
### Core Idea Component MLS

<table>
<thead>
<tr>
<th>Core Idea</th>
<th>Earth’s Place in the Universe</th>
</tr>
</thead>
<tbody>
<tr>
<td>Component</td>
<td>The History of Planet Earth</td>
</tr>
<tr>
<td>MLS</td>
<td>Identify evidence from patterns in rock formations and fossils in rock layers to support an explanation for changes in a landscape over time.</td>
</tr>
</tbody>
</table>

#### Expectation Unwrapped

[Clarification Statement: Examples of evidence from patterns could include rock layers with marine shell fossils above rock layers with plant fossils and no shells, indicating a change from land to water over time; and, a canyon with different rock layers in the walls and a river in the bottom, indicating that over time a river cut through the rock.]

### SCIENCE AND ENGINEERING PRACTICES

#### Constructing Applications and Designing Solutions
- Identify the evidence that supports particular points in an explanation.

### DISCIPLINARY CORE IDEAS

#### The History of Planet Earth
- Local, regional, and global patterns of rock formations reveal changes over time due to Earth forces such as earthquakes. The presence and location of certain fossil types indicate the order in which rock layers were formed.

### CROSSCUTTING CONCEPTS

#### Patterns
- Patterns can be used as evidence to support an explanation.

#### Stability and Change
- For natural and built systems alike, conditions of stability and determinants of rates of change or evolution of a system are critical elements of study.

### Content Limits/Assessment Boundaries

- Tasks should not include specific knowledge of the mechanism of rock formation or memorization of specific rock formations and layers.

### DOK Ceiling

- 3

### Item Format

- Selected Response
- Constructed Response
- Technology Enhanced

### Sample Stems
### Possible Evidence

- Students identify the explanation and the evidence relevant to supporting the explanation, including local and regional patterns in the following:
  - The different rock layers found in an area (e.g., rock layers taken from the same location show marine fossils in some layers and land fossils in other layers)
  - The ordering of rock layers (e.g., layer with marine fossils is found below layer with land fossils)
  - The presence of particular fossils (e.g., shells, land plants) in specific rock layers
  - The occurrence of events (e.g., earthquakes) due to Earth forces

- Students connect the evidence to support particular points of the explanation, including how specific rock layers in the same location show specific fossil patterns (e.g., some lower rock layers have marine fossils, while some higher rock layers have fossils of land plants). This pattern indicates that the landscape of the area was transformed into the landscape indicated by the upper layer (e.g., lower marine fossils indicate that, at one point, the landscape was covered by water, and upper land fossils indicate that the landscape was later dry land), and irregularities in the patterns of rock layers indicate disruptions due to Earth forces (e.g., a canyon with different rock layers in the walls and a river in the bottom, indicating that over time a river cut through the rock).

**Expectation Unwrapped**

[Clarification Statement: Examples of variables to test could include angle of slope in the downhill movement of water, amount of vegetation, speed of wind, relative rate of deposition, cycles of freezing and thawing of water, cycles of heating and cooling, and volume of water flow.]

**SCIENCE AND ENGINEERING PRACTICES**

**Planning and Carrying Out Investigations**

- Plan and conduct an investigation collaboratively to produce data to serve as the basis for evidence, using fair tests in which variables are controlled and the number of trials considered.

**DISCIPLINARY CORE IDEAS**

**Earth Materials and Systems**

- Rainfall helps to shape the land and affects the types of living things found in a region. Water, ice, wind, living organisms, and gravity break rocks, soils, and sediments into smaller particles and move them around.

**CROSSCUTTING CONCEPTS**

**Cause and Effect**

- Cause and effect relationships are routinely identified, tested, and used to explain change.

**ENGINEERING DESIGN**

Refer to Engineering, Technology, and Application of Science 4.ETS1B.1

**Content Limits/Assessment Boundaries**

- Tasks should not include more than one variable to test for weathering and erosion.
- Items should not assess a specific sequence in a procedure.

### Core Idea Component

**MLS**

**Component:** Plate Tectonics and Large-Scale Systems

**Expectation Unwrapped**

Analyze and interpret data from maps to describe patterns of Earth’s features.

[Clarification Statement: Maps can include topographic maps of Earth’s land and ocean floor, as well as maps of the locations of mountains, continental boundaries, volcanoes, and earthquakes.]

### SCIENCE AND ENGINEERING PRACTICES

**Analyzing and Interpreting Data**

- Analyze and interpret data to make sense of phenomena using logical reasoning.

### DISCIPLINARY CORE IDEAS

**Plate Tectonics and Large-Scale Systems**

- The locations of mountain ranges, deep ocean trenches, ocean floor structures, earthquakes, and volcanoes occur in patterns. Most earthquakes and volcanoes occur in bands that are often along the boundaries between continents and oceans. Major mountain chains form inside continents or near their edges. Maps can help locate the different land and water features of Earth.

### CROSSCUTTING CONCEPTS

**Patterns**

- Patterns can be used as evidence to support an explanation.

### Content Limits/Assessment Boundaries

- Topographic maps at this grade level should only include simple mountains, valleys and hills.

### DOK Ceiling

### Sample Stems

One example of a possible question related to this topic could be:

```
Question: How do maps help us understand the patterns of Earth’s features?

Answer: Maps provide a visual representation of Earth’s land and water features, including topographic maps that show the locations of mountains, valleys, and hills. These maps help us identify patterns such as the distribution of volcanoes and earthquakes along tectonic boundaries.
```
## Grades 3-5 SCIENCE

<table>

### Expectation Unwrapped

[Clarification Statement: Examples of solutions could include designing an earthquake resistant building and improving monitoring of volcanic activity.]

### Science and Engineering Practices

**Constructing Explanations and Designing Solutions**
- Generate and compare multiple solutions to a problem based on how well they meet the criteria and constraints of the design solution.

### Disciplinary Core Ideas

**Natural Resources**
- A variety of hazards result from natural processes (e.g., earthquakes, floods, tsunamis, volcanic eruptions, landslides, hurricanes). Humans cannot eliminate the hazards but can take steps to reduce their impacts.

### Crosscutting Concepts

**Cause and Effect**
- Cause and effect relationships are routinely identified, tested, and used to explain changes.

### Engineering Design

Refer to Engineering, Technology, and Application of Science 4.ETS1B.1
Refer to Engineering, Technology, and Application of Science 4.ETS1C.1

### Content Limits/Assessment Boundaries

- Tasks should not include any natural process beyond earthquakes, floods, tsunamis, volcanic eruptions, landslides, or hurricanes.
### Grades 3-5 SCIENCE

#### Possible Evidence

- When given a natural Earth process that can have a negative effect on humans (e.g., earthquakes, floods, tsunamis, volcanic eruptions, landslides, hurricanes), students describe and use cause and effect relationships between the Earth process and its observed effect to design at least two solutions that reduce its effect on humans.
- Students describe the criteria and constraints of the solution (e.g., cost, materials, time, relevant scientific information).
- Students evaluate, compare, and make improvements on each design solution based on how well it meets each of the given criteria and constraints.

#### Stimulus Materials

- Graphic organizers, diagrams, graphs, data tables, drawings
### Engineering, Technology, and Application of Science

<table>
<thead>
<tr>
<th>Core Idea Component</th>
<th>Engineering Design</th>
</tr>
</thead>
<tbody>
<tr>
<td>MLS</td>
<td>Defining and Delimiting Engineering Problems</td>
</tr>
</tbody>
</table>

Define a simple design problem reflecting a need or a want that includes specified criteria for success and constraints on materials, time, or cost.

#### Expectation Unwrapped

**Clarification:** Engineering Standards should be ongoing and continually integrated into science lessons/units. The ETS standards are written as a 3–5 grade span endpoint. Therefore, by the end of grade 5, students should be proficient in these skills. In grade 4, this engineering standard will be most successful when paired with, but not limited to, the following standards:

4.ESS3.A.1: Generate and compare multiple solutions to reduce the impacts of natural Earth processes on humans.
4.PS3.B.2: Apply scientific ideas to design, test, and refine a device that converts energy from one form to another.

#### SCIENCE AND ENGINEERING PRACTICES

**Asking Questions and Defining Problems**

- Define a simple design problem that can be solved through the development of an object, tool, process, or system and includes several criteria for success and constraints on materials, time, or cost.

#### DISCIPLINARY CORE IDEAS

**Defining and Delimiting Engineering Problems**

- Possible solutions to a problem are limited by available materials and resources (constraints). The success of a designed solution is determined by considering the desired features of a solution (criteria). Different proposals for solutions can be compared on the basis of how well each one meets the specified criteria for success or how well each takes the constraints into account.

#### CROSSCUTTING CONCEPTS

- N/A

#### INFLUENCE OF SCIENCE, ENGINEERING, AND TECHNOLOGY ON SOCIETY AND THE NATURAL WORLD

- People’s needs and wants change over time, as do their demands for new and improved technologies.

#### Possible Evidence

- Students identify the problem to be solved and define the boundaries of the system, the criteria, and the constraints or limitations on their design, which may include cost, materials, and time.

#### Stimulus Materials

Graphic organizers, diagrams, graphs, data tables, drawings
### Core Idea

#### Component

**MLS**

**Developing Possible Solutions**

Generate and compare multiple possible solutions to a problem based on how well each is likely to meet the criteria and constraints of the problem.

### Expectation Unwrapped

**Clarification:** Engineering Standards should be ongoing and continually integrated into science lessons/units. The ETS standards are written as a 3–5 grade span endpoint. Therefore, by the end of grade 5, students should be proficient in these skills. In grade 4, this engineering standard will be most successful when paired with, but not limited to, the following standards:

1. **4.PS2.B.1:** Plan and conduct a fair test to compare and contrast the forces (measured by a spring scale in Newtons) required to overcome friction when an object moves over different surfaces (i.e. rough/smooth).
2. **4.PS3.B.2:** Apply scientific ideas to design, test, and refine a device that converts energy from one form to another.
3. **4.ESS2.A.1:** Plan and conduct scientific investigations or simulations to provide evidence how natural processes (e.g. weathering and erosion) shape Earth’s surfaces.
4. **4.ESS3.A.1:** Generate and compare multiple solutions to reduce the impacts of natural Earth processes on humans.

### SCIENCE AND ENGINEERING PRACTICES

**Constructing Explanations and Designing Solutions**

- Generate and compare multiple solutions to a problem based on how well they meet the criteria and constraints of the design problem.

### DISCIPLINARY CORE IDEAS

**Developing Possible Solutions**

- Research on a problem should be carried out before beginning to design a solution. Testing a solution involves investigating how well it performs under a range of likely conditions.

### CROSSCUTTING CONCEPTS

- N/A
**Grades 3-5 SCIENCE**

**INFLUENCE OF SCIENCE, ENGINEERING, AND TECHNOLOGY ON SOCIETY AND THE NATURAL WORLD**

- Engineers improve existing technologies or develop new ones to increase their benefits, decrease known risks, and meet societal demands.

<table>
<thead>
<tr>
<th>Content Limits/Assessment Boundaries</th>
<th>Sample Stems</th>
</tr>
</thead>
<tbody>
<tr>
<td>• N/A</td>
<td></td>
</tr>
</tbody>
</table>

**Possible Evidence**

- Students use information from research and generate two possible solutions to the problem.
- Students share ideas to generate a variety of possible solutions and describe the necessary steps for designing a solution to the problem. Students describe the given criteria and constraints and how they will be used to generate and test the design solutions.
- Students test each solution, gather data to determine how well the solution meets the criteria, and compare solutions.

**Stimulus Materials**

Graphic organizers, diagrams, graphs, data tables, drawings
<table>
<thead>

<td>Optimizing the Solution Process</td>
</tr>
<tr>
<td>MLS</td>
<td>Plan and carry out fair tests in which variables are controlled and failure points are considered to identify aspects of a model or prototype that can be improved.</td>
</tr>
</tbody>
</table>

**Expectation Unwrapped**

**Clarification:** Engineering Standards should be ongoing and continually integrated into science lessons/units. The ETS standards are written as a 3-5 grade span endpoint. Therefore, by the end of grade 5, students should be proficient in these skills. In grade 4, this engineering standard will be most successful when paired with, but not limited to, the following standards:

4.ESS3.A.1: Generate and compare multiple solutions to reduce the impacts of natural Earth processes on humans.
4.PS3.B.2: Apply scientific ideas to design, test, and refine a device that converts energy from one form to another.

**SCIENCE AND ENGINEERING PRACTICES**

**Planning and Carrying Out Investigations**

- Plan and conduct an investigation collaboratively to produce data to serve as the basis for evidence, using fair tests in which variables are controlled and the number of trials considered.

**DISCIPLINARY CORE IDEAS**

**Optimizing the Solution Process**

- Tests are often designed to identify failure points or difficulties, which suggest the elements of the design that need to be improved. Different solutions need to be tested in order to determine which of them best solves the problem, given the criteria and the constraints.

**CROSSCUTTING CONCEPTS:**

- N/A

**Content Limits/Assessment Boundaries**

- Items should not assess a specific sequence in a procedure.
## Possible Evidence

- Students describe the purpose of the investigation and the evidence to be collected. Aspects that can be improved to better meet the criteria and constraints are identified.
- Students create a plan for the investigation that includes what is to be changed in each trial (independent variable), the outcome that will be measured (dependent variable), what tools and methods will be used to collect data, and what is to be kept the same to ensure a fair test.
- Students will carry out the investigation according to the developed plan.
